

Genetic Algorithm

A genetic algorithm is a heuristic search algorithm. This algorithm reflects the process of natural selection where the fittest individuals are selected for reproduction in order to produce offspring of the next generation.

phases of Genetic Algorithm

- 1) Initialization
- 2) fitness Assignment
- 3) selection
- 4) crossover (reproduction)
- 5) Termination.

Initial population

process begins with a set of individuals which is called a population

Each individual is a solution to the problem you want to solve as chromosome.

An individual is characterized by set of parameters (variables) known as genes

Genes are joined into a string to form a chromosome (solution)

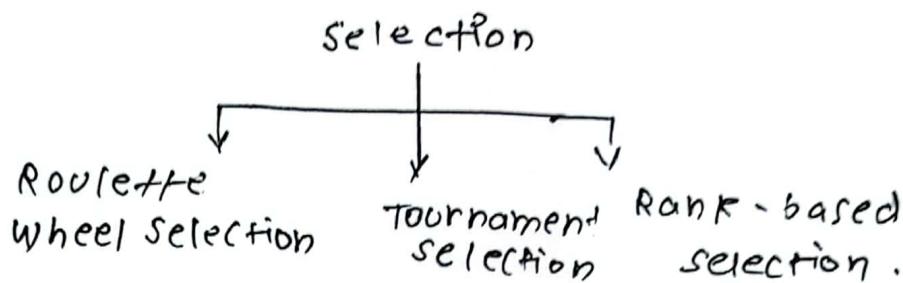

A1	0	0	0	0	0	0	0	Gene
A2	1	1	1	1	1	1	1	Chromosome
A3	1	0	1	0	1	1		
A4	1	1	0	1	1	1	0	population.

Fitness Function

- The Fitness function determine how fit an individual is? (the ability of an individual to compete with other individuals).

Selection

The idea of selection phase is to select the fitness individual and let them pass their genes to the next generation.

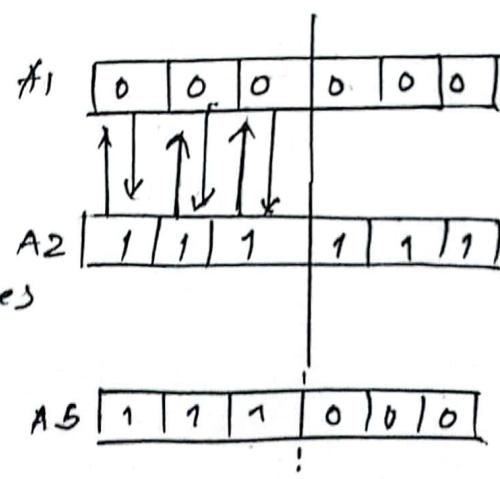

Crossover

- Crossover is the most significant phase in a genetic algorithm.
- For each pair of parents to be mated, a crossover point is chosen at random from within the genes.
- For example, consider the crossover point to 3 as shown.

Offspring

- Offspring are created by exchanging the genes of parent among themselves until the crossover point is reached.

- The new offspring are added to population

A5	1	1	1	0	1	0
A6	0	0	0	1	1	1

Mutation

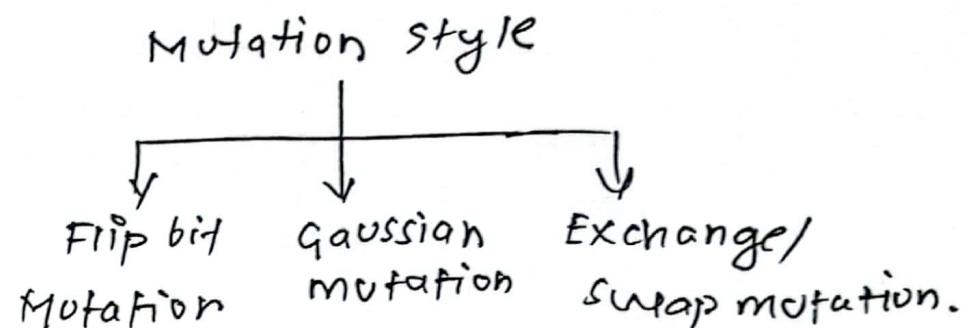

- 1) In certain new offspring formed, some of their genes can be subjected to a mutation with a low random probabilities.
- 2) This implies that some of the bits in the bit string can be flip flipped

before Mutation :-

A 5 | 1 1 1 0 0 0

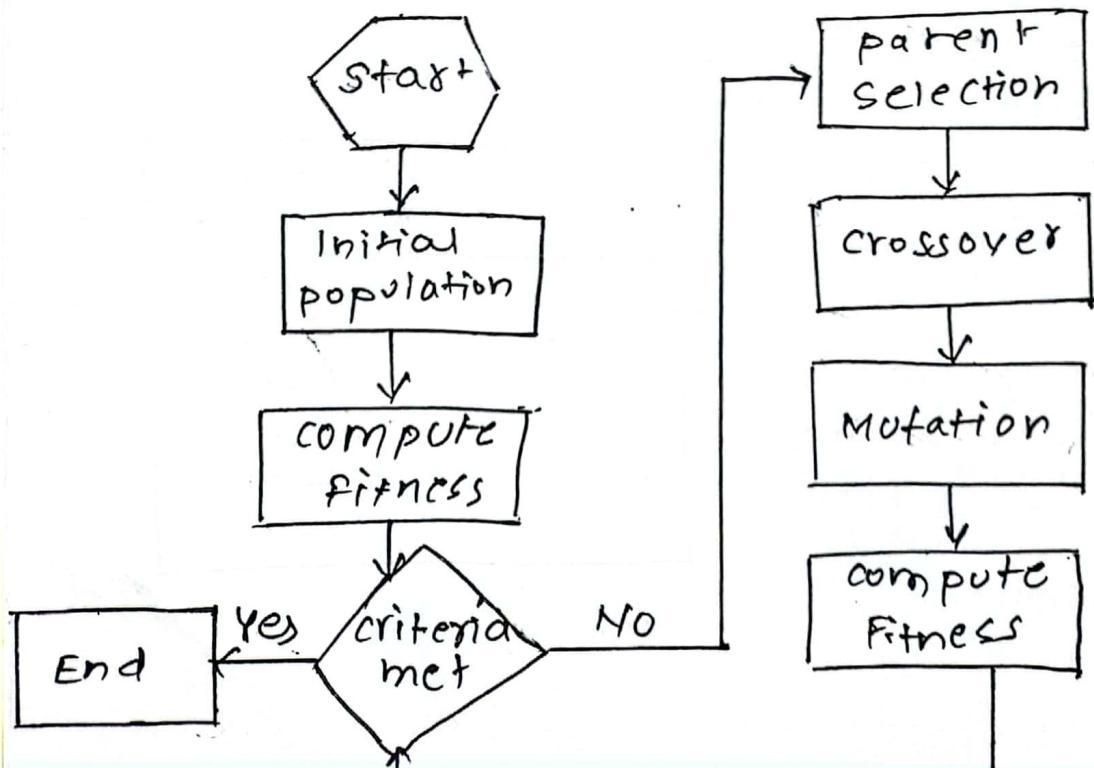

After Mutation :-

| 1 1 1 0 1 1 1 0

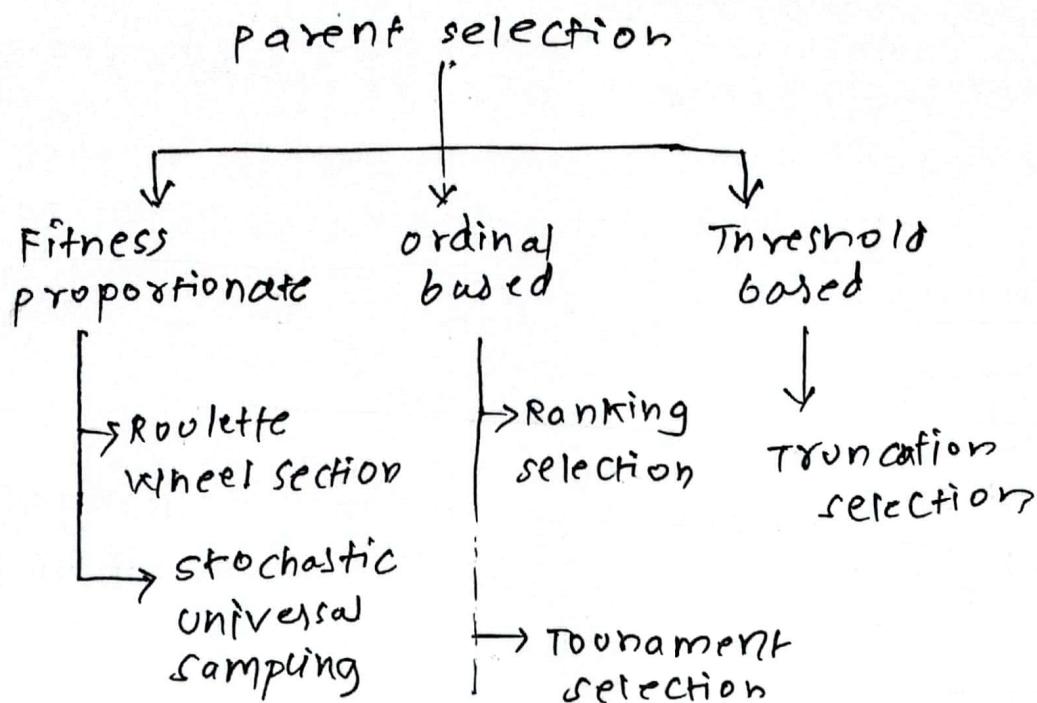

Termination

The algorithm terminates, if the population has converged (does not produce offspring which are significantly different from previous generation).

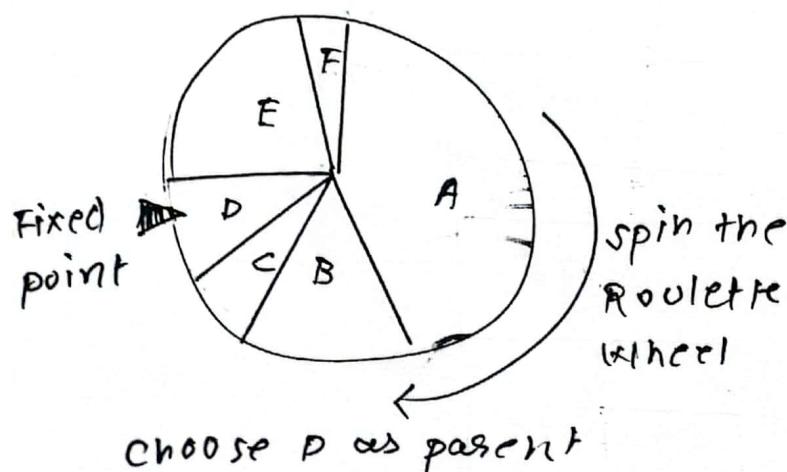

parent selection is a process of choosing a set of chromosomes as a parent a parent for the next generation of the population, based on its fitness value, threshold

Fitness proportionate: Fitter the individuals have higher chance of selection and propagating their features to the next generation.

Roulette wheel selection

chromosomes	fitness value
A	8.2
B	3.2
C	1.4
D	1.2
E	4.2
F	0.3

Roulette wheel selection

[sum]: calculate sum of all chromosome fitness in population - sums

[select]: generate random number from interval $(0, s)$ - r.

[loop]: go through the population and sum fitness from 0 and sum < when the sum s is greater than r, stop and return the chromosome where you are.

chromosome	Fitness value	sum(s)
A	8.2	0 - 8.2
B	3.2	8.2 - 11.4
C	1.4	11.4 - 12.8
D	1.2	12.8 - 14
E	4.2	14 - 18.2
F	0.3	18.2 - 18.6

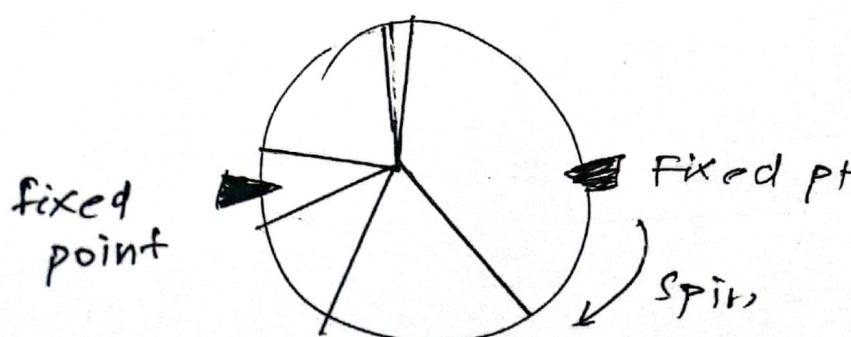

Annotations:

- Handwritten note: $(6, 5) - 7 = 0$ (with arrows pointing to the first two rows)
- Handwritten note: $8 = 1$ (with an arrow pointing to row B)
- Handwritten note: $13 = 2$ (with an arrow pointing to row E)

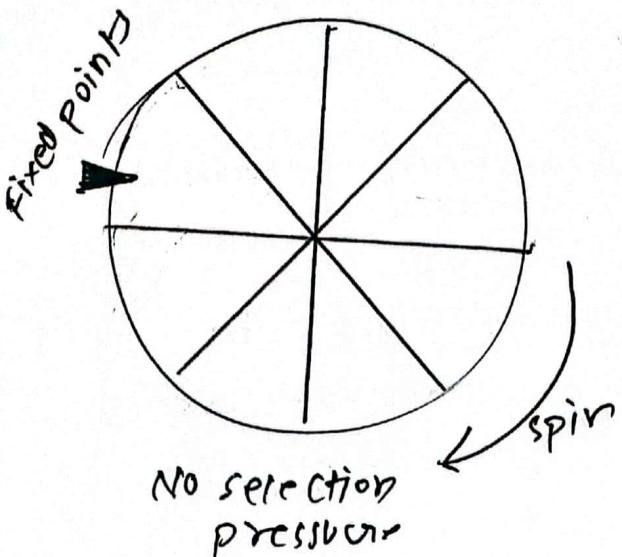

(OT)

Stochastic Universal Sampling (SUS)

same as Roulette wheel but has multiple fixed points

Ranking selection

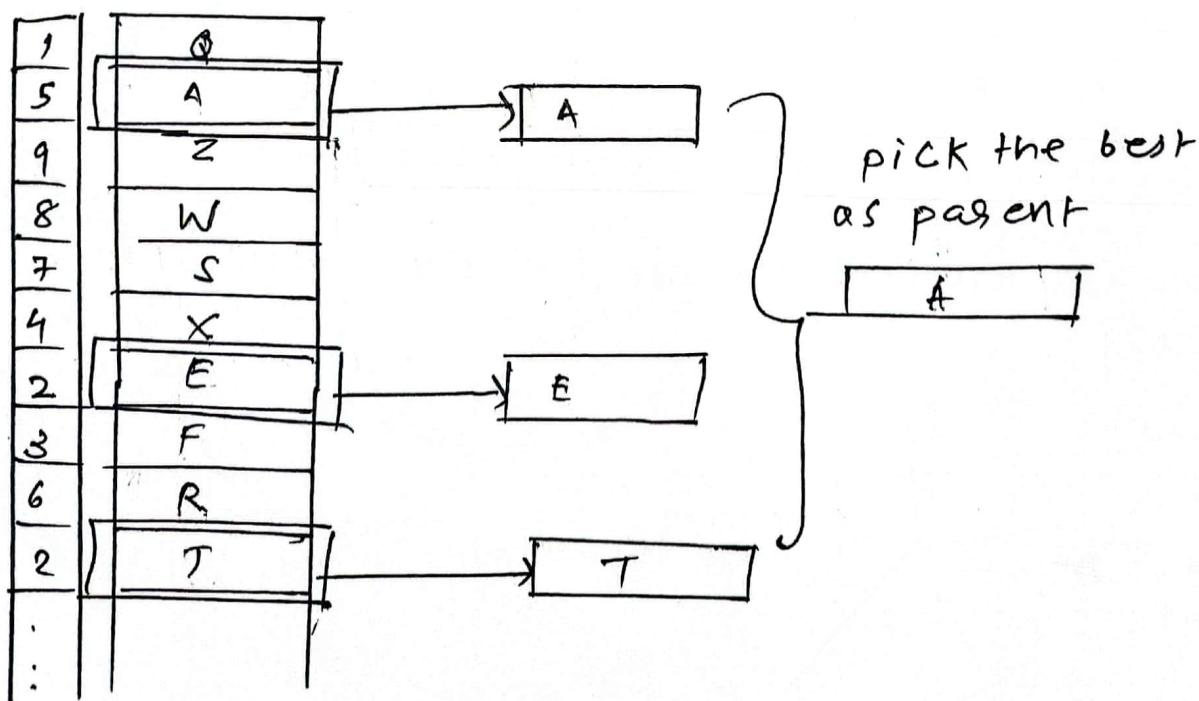

Every individual in the population is ranked according to fitness

selection depends on rank of each individual & not according to fitness

Tournament selection

k-way tournament selection
we have k individuals from the population at random and select the best out of these to become parent

Encoding Techniques.

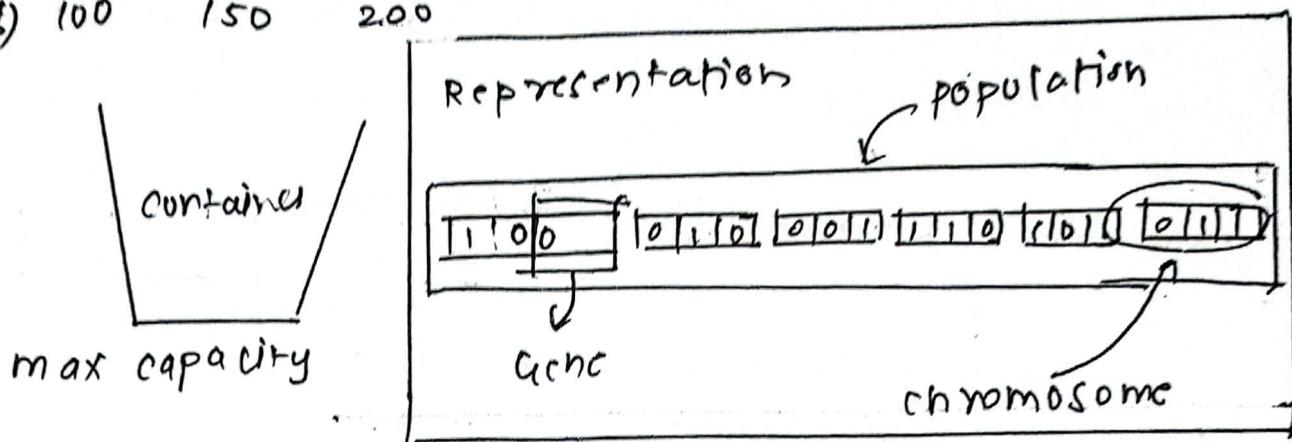

Binary - Encoding

0-1 Knapsack problem example :-

Q1)

A	B	C
weight (W)	10	15
profit (\$)	100	150

A, B, C, AB, AC, BC

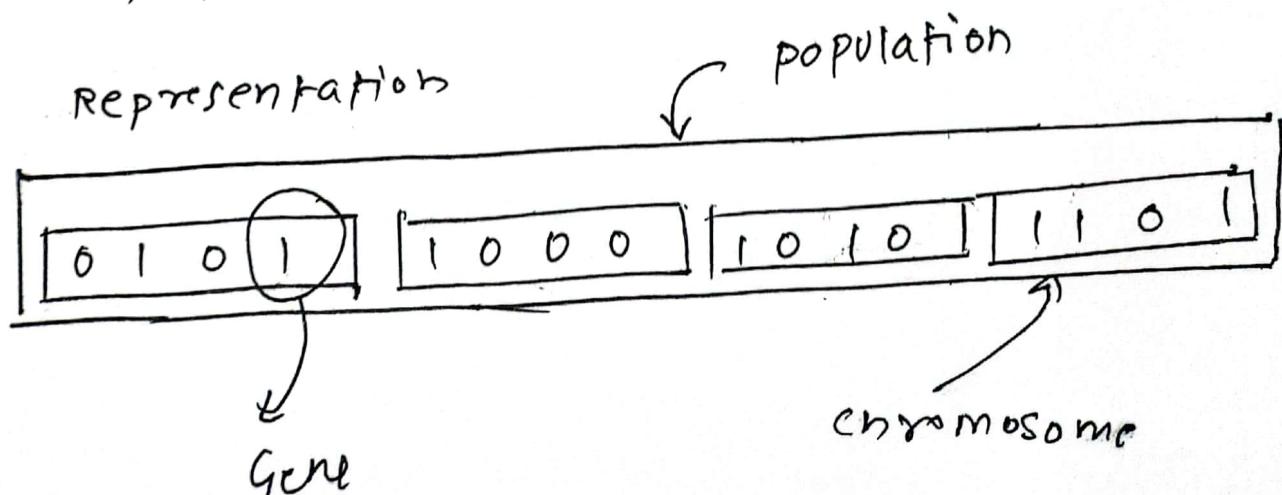

Q2) Example

$$f(x) = \frac{x^2}{2} + \frac{125}{x} \text{ where } 0 \leq x \leq 15$$

some of possible solutions without breaking constraints ($0 \leq x \leq 15$)

5, 8, 10 and 13

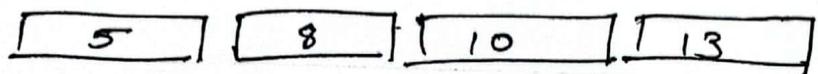

value encoding

defining the initial population for function

$$f(x) = \frac{x^2}{2} + \frac{125}{x}$$
 where $0 < x \leq 15$ x is any discrete integer

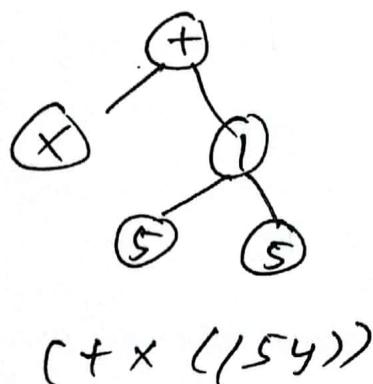

5, 8, 10, 13

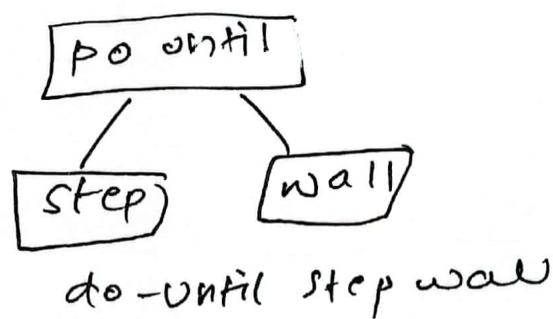

Tree Encoding

solution is encoded in binary tree

chromosome A

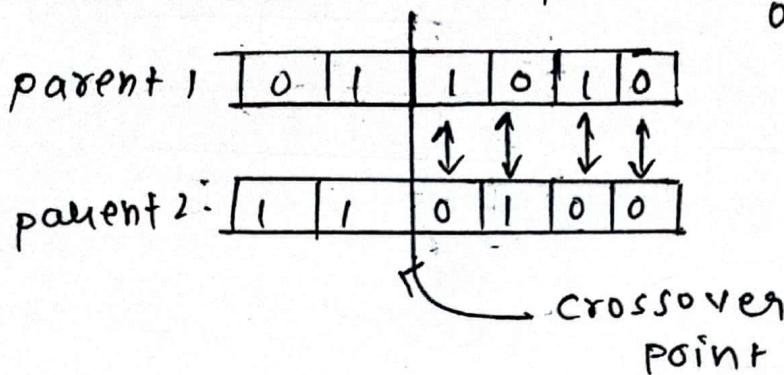

chromosome

single point crossover

Cross-over Techniques

Single-point crossover

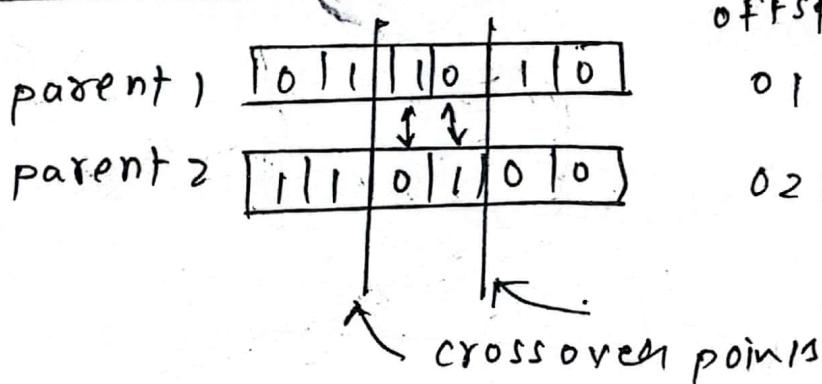

Offsprings

O1 | 0 | 1 | 0 | 1 | 0 | 0

O2 | 1 | 1 | 1 | 0 | 1 | 0

Two point crossover

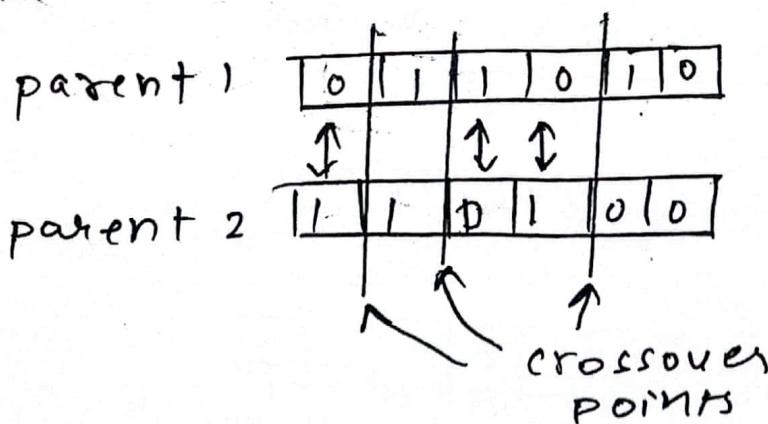

Offsprings

O1 : | 0 | 1 | 0 | 1 | 1 | 0

O2 : | 0 | 1 | 1 | 1 | 0 | 1 | 0

Multi-point crossover

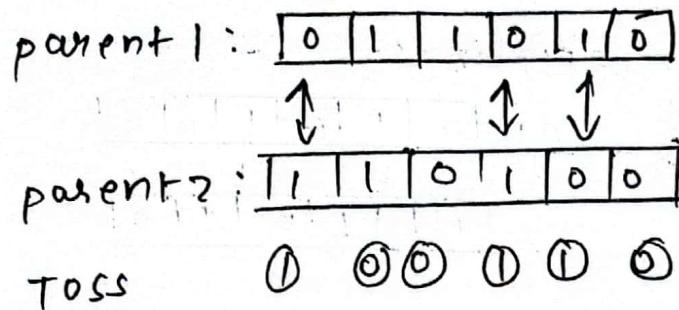

O1 : | 1 | 0 | 1 | 1 | 0

O2 : | 0 | 1 | 1 | 1 | 0 | 0 | 0

uniform crossover

Each bit position of parents, toss a coin
(let $H=1$ and $T=0$)

offspring:-

o1:

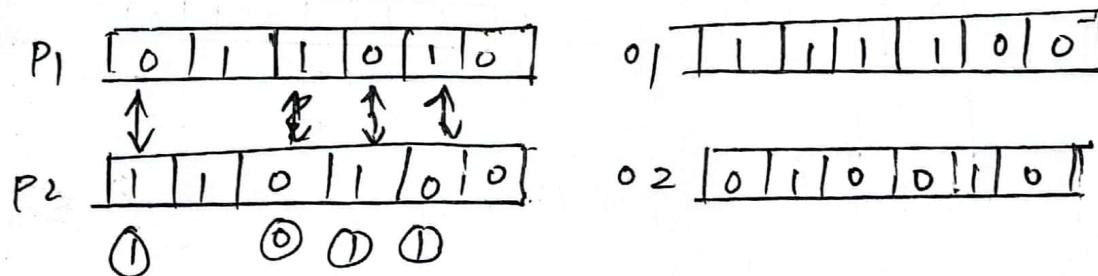

1	1	1	1	1	0
---	---	---	---	---	---

o2:

0	1	0	0	1	0
---	---	---	---	---	---

Half-uniform crossover

Toss a coin (let $H=1$ and $T=0$) only if the corresponding bits in P_1 and P_2 do not match

Uniform crossover with crossover mask (CM)

P_1

0	1	1	1	0	1	0
---	---	---	---	---	---	---

P_2

1	1	0	1	0	0
---	---	---	---	---	---

CM

0	1	0	1	1	0
---	---	---	---	---	---

↑ ↑

o1:

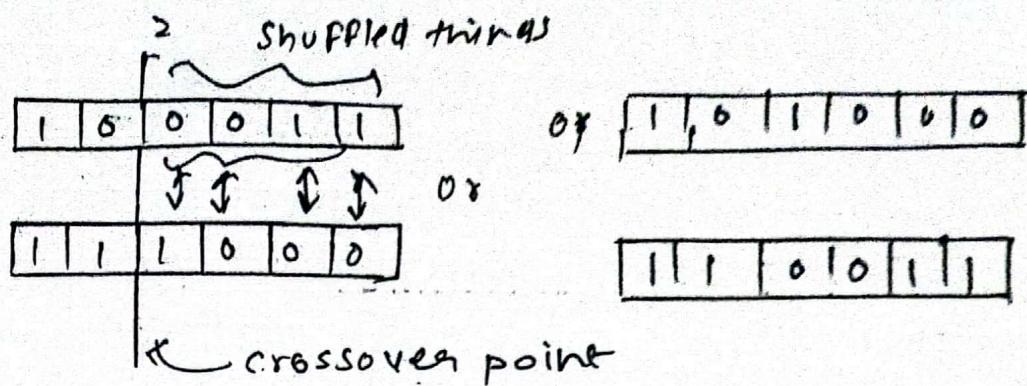

0	1	1	1	0	0
---	---	---	---	---	---

o2:

1	1	0	0	1	0
---	---	---	---	---	---

<p>if $CM = 0$ then select P_1 bit</p> <p>if $CM = 1$ then select P_2 bit</p>	<p>offspring o1</p> <p>if $CM = 0$ then select P_2 bit</p> <p>if $CM = 1$ Select P_1 bit</p>	<p>offspring o2</p>
---	--	---------------------

shuffle crossover

Three parent crossovers

P1 D | 1 | 1 | 0 | 1 | 0

P2 1 | 1 | 0 | 1 | 0 | 0

P3 1 | 0 | 0 | 1 | 0 | 1

combination (P1, P2, P3)

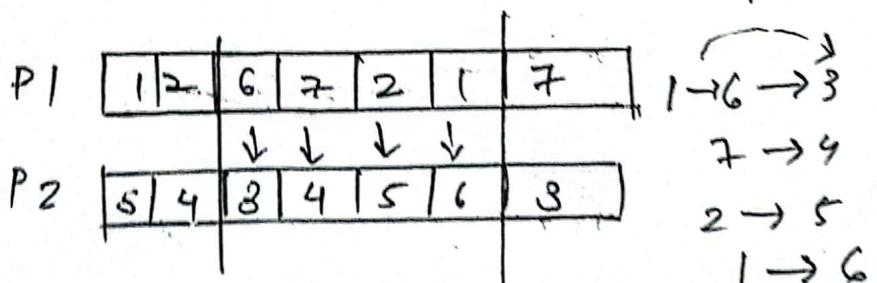

if P1 = P2 bit

then select P1 bit

if P1 bit != P2 bit

then select P3 bit

partially mapped crossover

Replace offsprings with where where 1 to 5

O1 8 | 2 | 6 | 7 | 2 | 1 | 4

O2 2 | 7 | 3 | 4 | 5 | 6 | 1

MUTATIONS - Genetic Algorithms

In each generation chromosomes undergo mutation and crossover and then selection to produce a better population whose candidates are near to desired solution.

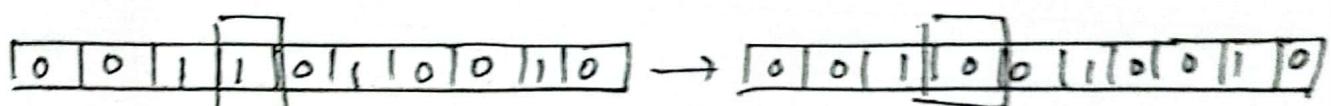

Mutation operator is a unary operator it needs only one parent to work on.

Select few genes from selected chromosome and apply desired mutation operator.

1. Bit Flip Mutation
2. Random Resetting Mutation
3. swap mutation
4. scramble mutation
5. Inversion Mutation

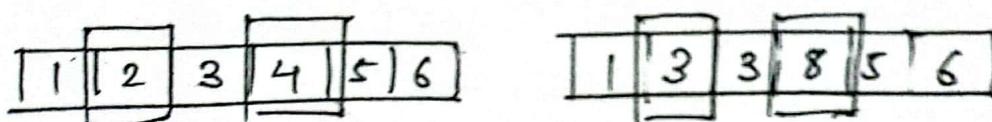

BIT Flip Mutation

we only use binary encoded GAs

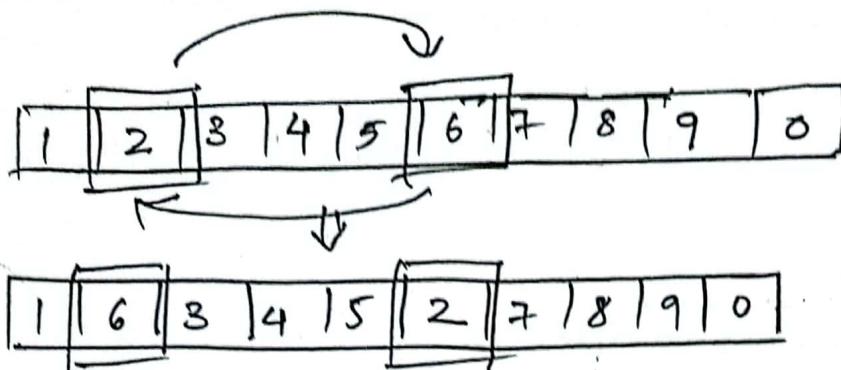

Random Resetting

only use integer representation

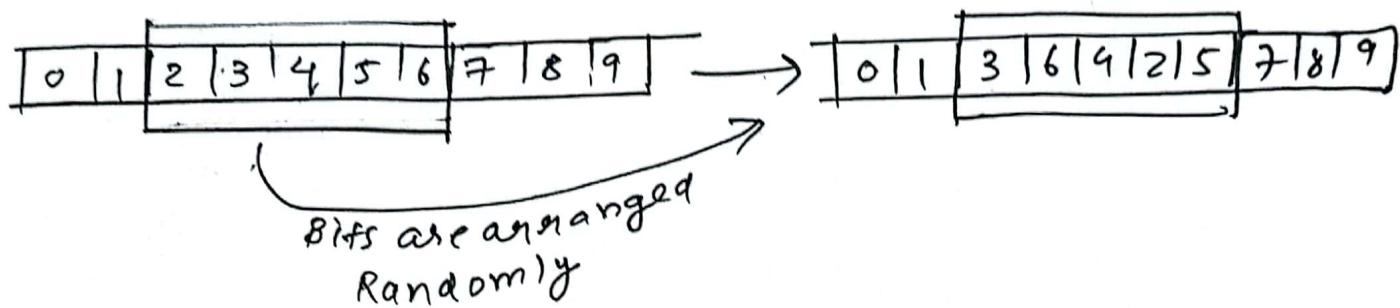

Swap Mutation.

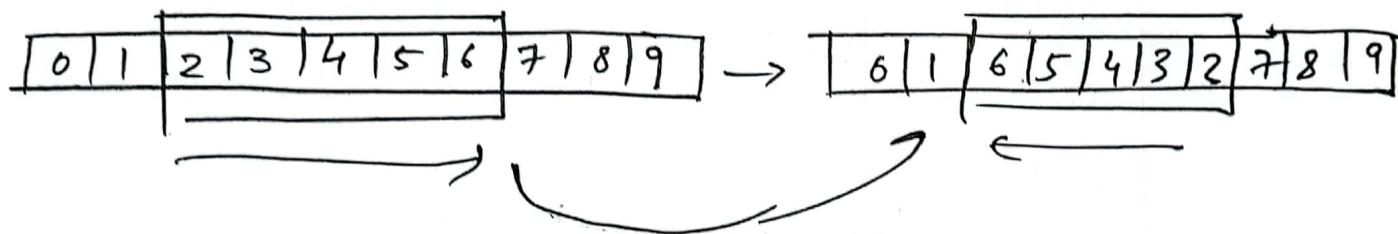

Select two positions at random and interchange values

Scramble Mutation

Inversion Mutation

Solved Examples

Q1) Consider the function of maximizing the function $f(x) = x^2$
 $0 \leq x \leq 31$ Range :

$$0 \leq x \leq 31 \text{ Range :}$$

Step 1: Select Encoding Technique

: Let's take Binary Encoding Technique.

1) Use five binary integers numbers between 0 (00000) and 31 (11111)

$$\text{objective } P(n) = x^2$$

Step 2: Select initial population

Select any number of size.

Let's take population size 4 but we can take any no. by choice

string No	Initial population (Randomly selected)	X value	fitness $f(x) = x^2$	prob	% prob	Expected count	Actual count
1	000 01100	12	144	0.1247			
2	11001	25	625	0.5411			
3	00101	5	25	0.0216			
4	10011	19	181				
sum			1155				
Average			288.75				
maximum			625				

$$\text{prob} = \frac{f(x)}{\sum f(x)} = \frac{144}{1155} = 0.1247$$
